INTRODUCTION

Let's look inside this hockey puck shaped wall adapter. This is an older USB AC wall adapter, not Level VI efficient, and discontinued.

TOOLS:

- [Hack saw](#) (1)
 - [Flathead Screwdriver](#) (1)
-

Step 1 — Crack Open The Case

- This power supply is slim and unusually attractive.
- That white case is 39mm in diameter, and 15mm thick: pretty small for this power level (see heat sinks later).
- The case is glued together, so you're not going to get into this one cleanly. I sawed a slot in the side, and used a screwdriver to crack the glue.

Step 2 — What's Inside?

- The wall power pins lead to two spring contacts.
- There's a plastic barrier between the low voltage and high voltage sides (you can't get much better than that!).

Step 3 — How about some detailed PCB Photos?

- Pretty tight layout.
- Note the heat sink with thermal interface material, and the landing pads for the line voltage springs.
